

The article informs of the newly-found location of *Euphorbia Davidii* Subils, Euphorbiaceae, Magnoliophyta on the territory of Saratov oblast. It is noted that the found population (near the Uvek village, Saratov oblast) contains several hundred plants and is confined to the ballast slope of the south-east exposition in close vicinity to the railroad. The overall population area is around 250 m². The plants go through the full life cycle. A considerable number of fruit-bearing plants were found. It is stated that the species under study is a quarantine weed which is dangerous for agriculture of Saratov oblast. The species is included in the Common List of Quarantine Objects of the Eurasian Economic Commission. The article concludes that it is necessary to destroy the found population using herbicides.
