

During the collecting plant material dodder field with infestation by gallformed insects from the vicinity of the city of Kislovodsk for the first time for midge fauna of Russia recorded the species – *Asphondylia serpylli* Kieffer, 1898. This species is widely distributed in Western Europe and his presence on the thyme in Russia may indicate invasion of this midges on the Eastern Europe. Future finds of this midge in other European regions of Russia will confirm this suggestion of the authors.
