Based on the database AWP “LesFond” set area and ecological distribution of the ten native species of undergrowth, invasive of the two and ten of alien woody plants in pine stands of four forest parks of Yekaterinburg: Southern, Nizhneisetsky, Shuvakish and forest park named after the Foresters of Russia. In the Southern forest park, the undergrowth occupies 88.3 % of the forest area. In plantations Nizhneilimskii forest park broom Russian is more common than in other forest parks (51.9 % of the forested area). This species is common in six types of forest. In the pine berry he dominates on 60 – 95 % of the forested area, preferring stagnant pine plantings with completeness 0.6 – 0.8. Optimal ecological niche of broom in all the parks, except for park forest them in Russian forestry is pine jagodnikov. A single broom noted in the lichen pine forests and cowberry-cranberry and spruce-pine forest, wet-jagodnikov. Invasive and artificially introduced species do not compete with natural undergrowth.

**Key words:** *Chamaecytisus ruthenicus*, type of forests, parks, coenopopulations, podlesnyi.
