Received 1 March 2019, Accepted 25 March 2019

The list of insects collected from flowering plants of *Tulipa suaveolens* in twelve populations in the Saratov, Volgograd, Rostov Provinces and the Republic of Kalmykia is noted in article. Collecting was carried out by mowing with a butterfly net between epy clusters of flowering plants, as well by hand from flowers. It was established that on this largest territory the collected insects similar in faunal structure. Most of them are typical pollinators and phytophages of the steppe zone of Russia. According to results of the study, there is no reason to believe that the effect of insect pollinators on *T. suaveolens* can be selective in nature and have affecting on the genetic structure of populations or have the originality of the biogeographic distribution of tepals color.

Key words: *Tulipa suaveolens* Roth, pollinators, insects, phytophages, flowering seed reproduction.
